Data Standards Subcommittee

SCTE STANDARD

SCTE 165-08 2019

IPCablecom 1.5 Part 8: Signaling MIB

NOTICE

The Society of Cable Telecommunications Engineers (SCTE) / International Society of Broadband Experts (ISBE) Standards and Operational Practices (hereafter called “documents”) are intended to serve the public interest by providing specifications, test methods and procedures that promote uniformity of product, interchangeability, best practices and ultimately the long-term reliability of broadband communications facilities. These documents shall not in any way preclude any member or non-member of SCTE•ISBE from manufacturing or selling products not conforming to such documents, nor shall the existence of such standards preclude their voluntary use by those other than SCTE•ISBE members.

SCTE•ISBE assumes no obligations or liability whatsoever to any party who may adopt the documents. Such adopting party assumes all risks associated with adoption of these documents, and accepts full responsibility for any damage and/or claims arising from the adoption of such documents.

Attention is called to the possibility that implementation of this document may require the use of subject matter covered by patent rights. By publication of this document, no position is taken with respect to the existence or validity of any patent rights in connection therewith. SCTE•ISBE shall not be responsible for identifying patents for which a license may be required or for conducting inquiries into the legal validity or scope of those patents that are brought to its attention.

Patent holders who believe that they hold patents which are essential to the implementation of this document have been requested to provide information about those patents and any related licensing terms and conditions. Any such declarations made before or after publication of this document are available on the SCTE•ISBE web site at <http://www.scte.org>.

This page is intentionally left blank.

1 SCOPE

This specification describes the IPCablecom Signaling (SIG) MIB requirements.

2 REFERENCES

The following documents contain provisions which, through reference in this text, constitute provisions of this standard. At the time of Subcommittee approval, the editions indicated were valid. All documents are subject to revision, and while parties to agreement based on this standard are encouraged to investigate the possibility of applying the most recent editions of the documents listed below, they are reminded that newer editions of those documents might not be compatible with the referenced version.

2.1 Normative References

In order to claim compliance with this standard, it is necessary to conform to the following standards and other works as indicated, in addition to the other requirements of this standard. Intellectual property rights may be required to implement these references.

- [1] ANSI/SCTE 165-06 2019, IPCablecom 1.5 Part 6: MIBs Framework Specification.
- [2] ANSI/SCTE 165-03 2016, IPCablecom 1.5 Part 3: Network-Based Call Signaling Protocol.
- [3] ANSI/SCTE 165-05 2019, IPCablecom 1.5 Part 5: MTA Device Provisioning.

2.2 Informative References

The following documents may provide valuable information to the reader but are not required when complying with this standard.

- [4] ANSI/SCTE 165-01 2019, IPCablecom 1.5 Part 1: Architecture Framework Technical Report.
- [5] IETF RFC 3261, SIP: Session Initiation Protocol, February 2002.

3 ABBREVIATIONS

There are no abbreviations used in this document.

4 REQUIREMENTS

The Signaling MIB MUST be implemented as defined below.

```

DESCRIPTION
    "This MIB module supplies the basic management
    object for the PacketCable Signaling
    protocols. This version of the MIB includes
    common signaling and Network Call Signaling
    (NCS) related signaling objects.

STATUS             current
DESCRIPTION
    "Textual Convention defines various types of
    CODECs that MAY be supported.  The list of CODECs
    MUST be consistent with the Codec RTP MAP Parameters
    Table in the PacketCable CODEC specification.  In-line
    embedded comments below contain the Literal Codec Name
    for each CODEC.  The Literal Codec Name corresponds to
    the second column of the Codec RTP MAP Parameters Table.
    The Literal Codec Name Column contains the CODEC name
    that is used in the LCD of the NCS messages CRCX/MDCX,
    and is also used to identify the CODEC in the CMS
    Provisioning Specification.  The RTP Map Parameter
    Column of the Codec RTP MAP Parameters Table contains
    the string used in the media attribute line ('a=') of the
    SDP parameters in NCS messages."

PktcRingCadence   ::= TEXTUAL-CONVENTION
STATUS             current
DESCRIPTION
    "This object represents a ring cadence in bit string
    format.  The ring cadence representation starts with the
    first 1 in the pattern (the leading 0s in the MSB are
    padding and are to be ignored).  Each bit
    represents 100ms of tone; 1 is tone, 0 is no tone.  64
    bits MUST be used for cadence representation, LSB 4 bits
    are used for representing repeatable characteristics.
    0000 means repeatable, and 1000 means non repeatable.
    During SNMP SET operations 64 bits MUST be used,
    otherwise MTA MUST reject the value.  As an example, the
    hex representation of a ring cadence of 0.5 secs on; 4
    secs off; repeatable would be:0x0001F00000000000."

STATUS      current
DESCRIPTION
    "This object contains a string indicating the call agent
    name(e.g.: ca@abc.def.com). The call agent name
    after the character '@', MUST be a fully qualified
    domain name and MUST have a corresponding
    pktcMtaDevCmsFqdn entry in the pktcMtaDevCmsTable. For
    each particular end-point, the MTA MUST use the current
    value of this object to communicate with the corresponding
    CMS. The MTA MUST update this object with the value of the
    'Notified Entity' parameter of the NCS message. If the
    Notified Entity parameter does not contain a CallAgent
    port, the MTA MUST update this object with default value
    of 2727. Because of the high importance of this object to
    the ability of the MTA to maintain reliable NCS
    communication with the CMS, it is highly recommended not
    to change this object's value through management station
    during normal operations."

        disconnected          (3)
    }
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
        "This object contains the error status for this interface.
        The operational state indicates that all operations
        necessary to put the line in service have occurred and CMS
        has acknowledged the RSIP message successfully.
        If 'pktcMtaDevCmsIpsecCtrl' is enabled for the associated
        Call Agent, the noSecurityAssociation status indicates
        that no Security Association (SA) yet exists for this
        endpoint. Otherwise, the state is unused.
        The disconnected status indicates one of the following two:
        1. If 'pktcMtaDevCmsIpsecCtrl' is disabled then no
        security association is involved with this endpoint: the
        NCS signaling Software is in process of establishing the
        NCS signaling Link via an RSIP exchange.
        2. Otherwise, pktcMtaDevCmsIpsecCtrl is enabled, the
        security Association has been established and the NCS
        signaling Software is in process of establishing the NCS
        signaling Link via an RSIP exchange."
