IPCablecom 1.5 Part 15: Management Event MIB Specification

NOTICE

The Society of Cable Telecommunications Engineers (SCTE) / International Society of Broadband Experts (ISBE) Standards and Operational Practices (hereafter called "documents") are intended to serve the public interest by providing specifications, test methods and procedures that promote uniformity of product, interchangeability, best practices and ultimately the long-term reliability of broadband communications facilities. These documents shall not in any way preclude any member or non-member of SCTE•ISBE from manufacturing or selling products not conforming to such documents, nor shall the existence of such standards preclude their voluntary use by those other than SCTE•ISBE members.

SCTE•ISBE assumes no obligations or liability whatsoever to any party who may adopt the documents. Such adopting party assumes all risks associated with adoption of these documents, and accepts full responsibility for any damage and/or claims arising from the adoption of such documents.

Attention is called to the possibility that implementation of this document may require the use of subject matter covered by patent rights. By publication of this document, no position is taken with respect to the existence or validity of any patent rights in connection therewith. SCTE•ISBE shall not be responsible for identifying patents for which a license may be required or for conducting inquiries into the legal validity or scope of those patents that are brought to its attention.

Patent holders who believe that they hold patents which are essential to the implementation of this document have been requested to provide information about those patents and any related licensing terms and conditions. Any such declarations made before or after publication of this document are available on the SCTE•ISBE web site at http://www.scte.org.

1 INTRODUCTION

1.1 Introduction and Overview

The Management Event MIB provides a common data and format definition for events (informative, alarm, etc.). It also specifies by what means events are transmitted. Use of a common event mechanism facilitates management of the MTA in a multi-vendor environment and provides a standard means to implement IPCablecom specified events.

1.2 Purpose of Document

This document describes an SNMP MIB in SMIv2, to support the management event mechanism as described in [1]. It is intended to be implemented in the MTA and management devices.

1.3 Organization of Document

The Management Event MIB defined in this document provides a set of objects required for the management of IPCablecom compliant MultiMedia Terminal Adapter (MTA) devices. The mechanisms to control the event reporting are defined in this specification.

This MIB is structured as six groups:

pktcDevEventControl	Management information that controls the event reporting
pktcDevEventConfig	Management information that configures the reporting of the various programmable events
pktcDevEventThrottle	Management information that configures the event throttling control
pktcDevEventLocal	Management information that configures that allows the retrieval of events via SNMP
pktcDevEventNotify	Management information that specifies the information sent in traps and informs
pktcDevEventNotification	Management information that defines the trap and inform messages

1.4 Requirements and Conventions

Throughout this document, the words that are used to define the significance of particular requirements are capitalized. These words are:

"MUST"	This word or the adjective "REQUIRED" means that the item is an absolute requirement of this specification.
"MUST NOT"	This phrase means that the item is an absolute prohibition of this specification.
"SHOULD"	This word or the adjective "RECOMMENDED" means that there may exist valid reasons in particular circumstances to ignore this item, but the full implications should be understood and the case carefully weighed before choosing a different course.
"SHOULD NOT"	This phrase means that there may exist valid reasons in particular circumstances when the listed behavior is acceptable or event useful, but the full implications should be understood and the case carefully weighed before implementing any behavior described with this label.
"MAY"	This word or the adjective "OPTIONAL" means that this item is truly optional. One vendor may choose to include the item because a particular marketplace requires it or because it enhances the product, for example; another vendor may omit the same item.

2 REFERENCES

The following documents contain provisions which, through reference in this text, constitute provisions of this standard. At the time of Subcommittee approval, the editions indicated were valid. All documents are subject to revision, and while parties to agreement based on this standard are encouraged to investigate the possibility of applying the most recent editions of the documents listed below, they are reminded that newer editions of those documents might not be compatible with the referenced version.

2.1 Normative References

In order to claim compliance with this standard, it is necessary to conform to the following standards and other works as indicated, in addition to the other requirements of this standard. Intellectual property rights may be required to implement these references.

3 TERMS AND DEFINITIONS

This IPCablecom document uses the following terms and definitions:

Endpoint A Terminal, Gateway, or MCU

4 ABBREVIATIONS AND ACRONYMS

This IPCablecom document uses the following abbreviations:

E-MTA Embedded MTA – a single node which contains both an MTA and a cable modem.

FQDN Fully Qualified Domain Name. Refer to IETF RFC 1594 for details.

IANA Internet Assigned Numbered Authority. See www.ietf.org for details.

IETF Internet Engineering Task Force. A body responsible, among other things, for developing standards used in the Internet.

IP Internet Protocol. An Internet network-layer protocol.

MAC Media Access Control. It is a sublayer of the Data Link Layer. It normally runs directly over the physical layer.

MTA Multimedia Terminal Adapter.

OSS Operations Systems Support. The back office software used for configuration, performance, fault, accounting and security management.

SNMP Simple Network Management Protocol.

5 IPCABLECOM MANAGEMENT EVENT MIB

The IPCablecom 1.5 Management Event MIB MUST be implemented as defined below.

    SYNTAX       BITS {
```

```
                resetEventLogTable(0),
                resetEventDescrTable(1)
                }    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION
            "This MIB object defines the actions related to the event
            log configuration.

            The MTA MUST take the appropriate action whenever
            a bit is set to a value of '1'.

            Setting the resetEventLogTable(0) bit to
            a value of '1' clears the entire event log
            (Deletes all entries in pktcDevEventLogTable).

            Setting  resetEventDescrTable(1) to a value of '1'
            resets the pktcDevEventDescrTable to the
            factory default values.

            Setting a control bit to a value of '0' MUST not result in
            any action.

            Reading this MIB object MUST always return '00'."
    ::= { pktcDevEventControl 1 }

pktcDevEvSyslogAddressType  OBJECT-TYPE
    SYNTAX      InetAddressType
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION
            "This MIB Object defines the address type of the
            Syslog server.
            PacketCable devices implementing this MIB MUST
            support an InetAddressType of ipv4(1).
            PacketCable devices MAY optionally implement other
            address types.

            If an unsupported InetAddressType is used to set
            this object, the PacketCable device MUST reject it
            and report an SNMP error stating 'wrong value'.

            If an SNMP SET results in a type that does not match
            the value contained in the MIB Object
            pktcDevEvSyslogAddress, the PacketCable device MUST
            reject the SNMP SET with an 'inconsistent value'
            error."
    ::= { pktcDevEventControl 2 }

pktcDevEvSyslogAddress  OBJECT-TYPE
    SYNTAX      InetAddress
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION
            "This MIB Object contains the IP address of the
            Syslog server. If this is set to either 0.0.0.0 or
            255.255.255.255 the device MUST inhibit syslog
            transmission.
            The use of FQDNs is syntactically allowed, but
            discouraged since a failure to resolve them in a
            timely manner may leave the device without access to
            the Syslog daemon during critical network events.
            The type of address this object represents is defined
            by the MIB Object pktDevEvSyslogAddressType.
```

```
            If an SNMP SET results in a type that does not match
            that indicated by the MIB Object
            pktcDevEvSyslogAddressType, the PacketCable device MUST
            reject the SNMP SET with an 'inconsistent value'
            error."
    ::= { pktcDevEventControl 3 }

pktcDevEvSyslogUdpPort  OBJECT-TYPE
    SYNTAX      InetPortNumber
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION
            "This MIB Object contains the UDP Port Number of the Syslog
             Server. The PacketCable device must send the Syslog
             messages to this port on the Syslog Server."
    DEFVAL { 514 }
    ::= { pktcDevEventControl 4 }

--
--   Event throttling control
--

pktcDevEvThrottleAdminStatus  OBJECT-TYPE
    SYNTAX      INTEGER {
                unconstrained(1),
                maintainBelowThreshold(2),
                stopAtThreshold(3),
                inhibited(4)
                }
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION

            "This MIB Object controls the throttling of the
            transmitted messages upon generation of an event
            (SNMP/Syslog).

            A value of unconstrained(1) causes event messages
            to be transmitted without regard to the threshold
            settings.

            A value of maintainBelowThreshold(2) causes event
            messages to be suppressed if the number of transmissions
            would otherwise exceed the threshold.
            A value of stopAtThreshold(3) causes event message
            transmission to cease at the threshold, and not
            resume until directed to do so.

            A value of inhibited(4) causes all event message
            Transmission to be suppressed.

            An event causing both an SNMP and a Syslog message
            is still treated as a single event.

            Writing to this object resets the thresholding state.

            Refer to MIB Objects pktcDevEvThrottleThreshold and
            pktcDevEvThrottleInterval for information on throttling."
    DEFVAL { unconstrained }
    ::= { pktcDevEventThrottle 1 }
```

```
pktcDevEvThrottleThreshold  OBJECT-TYPE
    SYNTAX      Unsigned32
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION
            "This MIB Object contains the number of events per
            pktcDevEvThrottleInterval to be transmitted before
            throttling.

            An event causing both a  SNMP and a syslog message is
            still treated as a single event."
    DEFVAL { 2 }
    ::= { pktcDevEventThrottle 2 }

pktcDevEvThrottleInterval  OBJECT-TYPE
    SYNTAX      Unsigned32
    UNITS       "seconds"
    MAX-ACCESS  read-write
    STATUS      current
    DESCRIPTION

            "This MIB Object contains the interval over which
             the throttle threshold applies."    DEFVAL { 1 }
    ::= { pktcDevEventThrottle 3 }

---
-- Status Reporting
---

pktcDevEvTransmissionStatus  OBJECT-TYPE

    SYNTAX      BITS {
                syslogThrottled(0),
                snmpThrottled(1),
                validSyslogServerAbsent(2),
                validSnmpManagerAbsent(3),
                syslogTransmitError(4),
                snmpTransmitError(5)
                }
    MAX-ACCESS  read-only
    STATUS      current
    DESCRIPTION
            "This MIB Object reflects the status of the event
             transmission.

            If a bit corresponding to a state is set to a value
            of:
                '1', it indicates that the state is true
                '0', it indicates that the state is false

            'Event throttling' is based on thresholds and the current
            setting of pktcDevEvThrottleAdminStatus.

            'Server/Manager' indicators must be based on the
            availability of valid Syslog server/SNMP managers.

            'Transmit Errors' must only be used in cases where the
            PacketCable Device can identify unavailable servers."

    ::= { pktcDevEventStatus 1 }
```

    DESCRIPTION
            "This MIB Object defines the action to be taken on
            occurrence of this event class.

            Setting a bit to a value of '1' indicates that the
            corresponding action will be taken upon occurrence of
            this event, provided the required parameters are present.
            (e.g.: Syslog Server for Syslog messages, SNMP targets for
            SNMP traps and SNMP INFORMs etc). If none of the bits
            are set then no action is taken upon occurrence of the
            event.

             The default value of this MIB Object is dependent on the
             value of the MIB Object 'pktcDevEventDescrLevel', for the
             corresponding event.

            For the following values of 'pktcDevEventDescrLevel':
               emergency(0), alert(1), critical(2) and error(3),
            the PacketCable device MUST set the bits for local(0),
            syslog(1) and snmpInform(3) to a value of '1' and the rest
            to a value of '0'.

            For all the remaining values of 'pktcDevEventDescrLevel',
            the PacketCable device MUST set the bits for local(0) and
            syslog(1) to a value of '1' and the rest to a value of
            '0'."
