# WAN Links Are Outpacing LAN Links

- Apple released gigabit Ethernet on Power Mac G4s in 2004
- Only recently with 802.3bz will LAN Ethernet get a speed boost

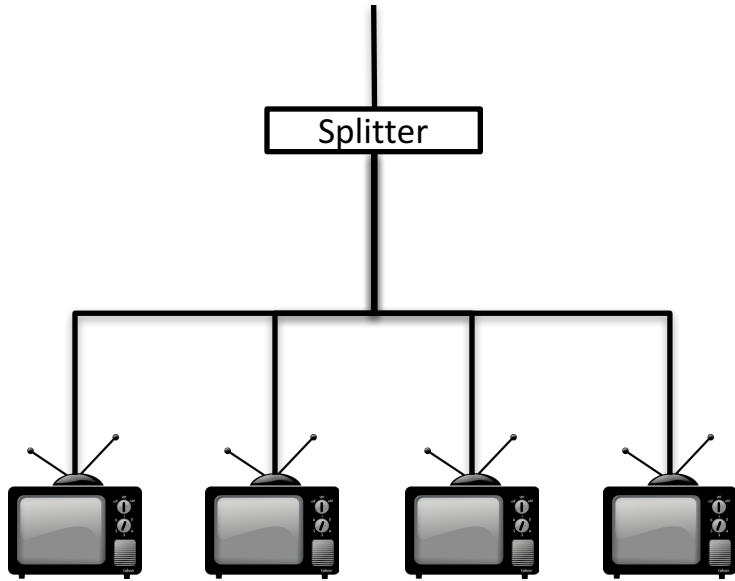

COMCAST BROADBAND SPEED OFFERING

# 6 Eras of LAN CPE Architecture

1. **Analog delivery** – No CPE
2. **Digital QAM Video** – Independent CPE
3. **MDVR** – Centralized DVR
4. **Hybrid-IP** – MoCA/Wi-Fi only clients
5. **Multicast** – DVR STB not required
6. **BYO CPE** – Streaming direct to TVs or retail devices

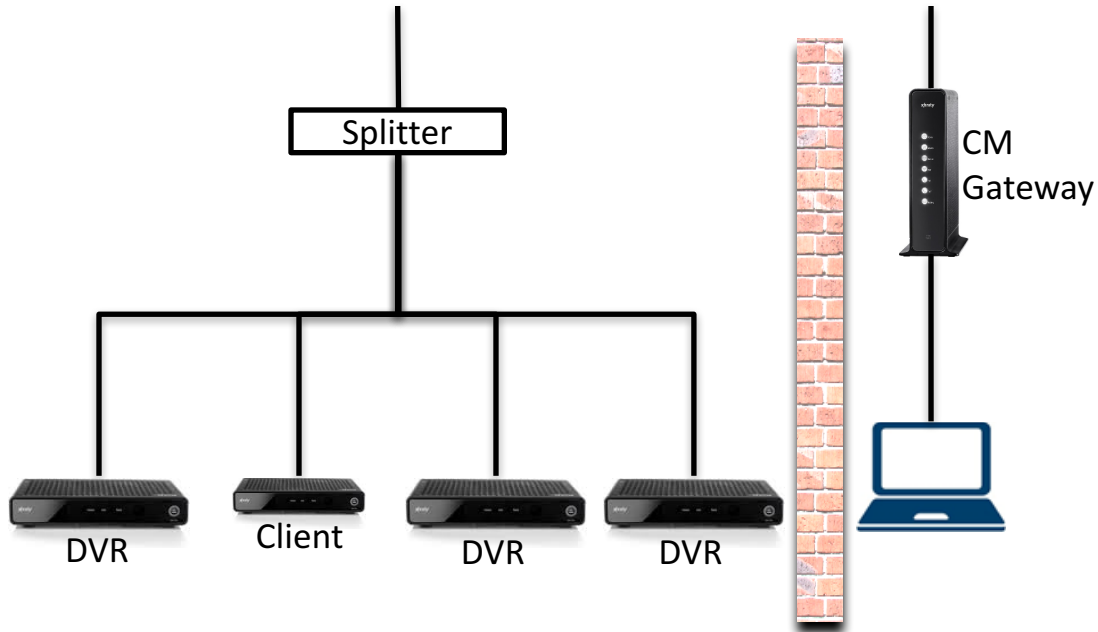

# Analog Era

- **Triggered by:** poor OTA reception, and a desire for more channels
- STBs are often not required
- Extremely limited features
- High fidelity/quality access network
- No high speed internet

DVR Client Requirements:  
Not available

# Digital QAM Video Era

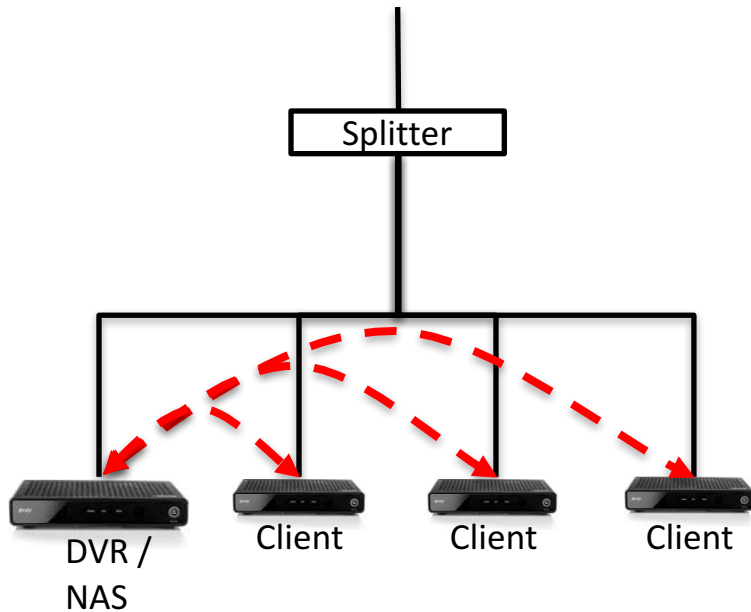

- **Triggered by:** MPEG2 codec, and QAM distribution
- STBs have no communication to any other device in the home
- Customers make individual STB decisions per TV
- Enables DOCSIS

## DVR Client Requirements:

HDD, Cable Card, QAM Tuner, DOCSIS Tuner

# MDVR Era

- **Triggered by:** MoCA
- Allowed for one centralized DVR in the home
- Lowered the cost of client STBs
- STBs mainly communicated to other STBs, and not COAM devices
- A NAS architecture was possible

## DVR Client Requirements:

**HDD**, Cable Card, QAM Tuner, DOCSIS Tuner

Central DVR

# Hybrid-IP Era

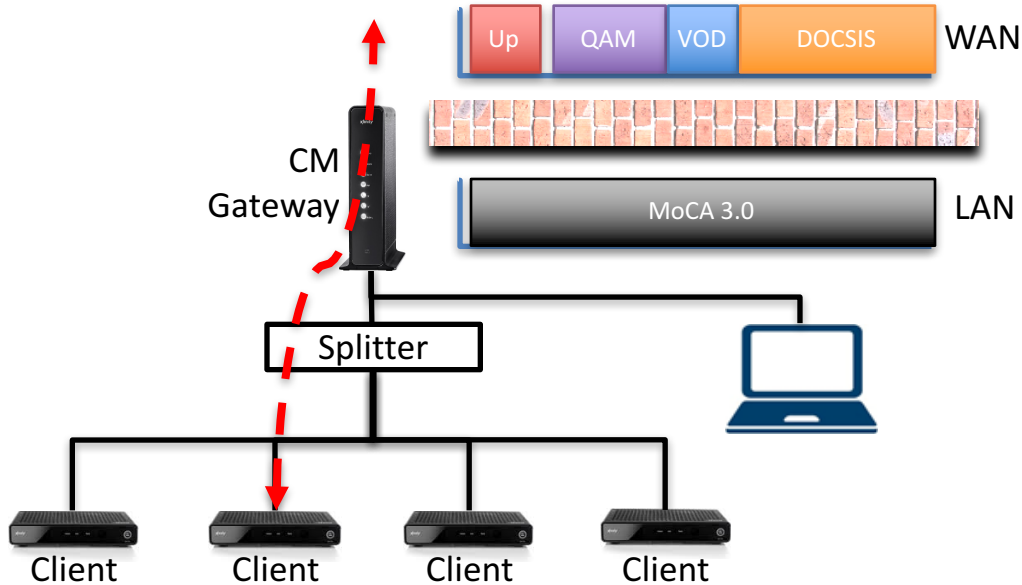

- **Triggered by:** Cable card regulation relaxation, and CDVR MPEG4 file based encoding
- All client STB connectivity is via MoCA to a DVR STB
- Allowed reduced cost client STBs
- MPEG4 CDVR allowed COAM file based playback
- First STB to COAM communication for vidipath and IP control

## DVR Client Requirements:

HDD, **Cable Card**, **QAM Tuner**, **DOCSIS Tuner**

Central DVR, **TSB**

# Multicast Era

- **Triggered by:** advances in back office encoding and packaging
- DVR STB is no longer required
- Separate WAN and LAN networks allow increased capacity and ease fiber deployments
- Multiple levels of in-home caching
- D3.1 is key to support IP and QAM channel lineups on plant simultaneously

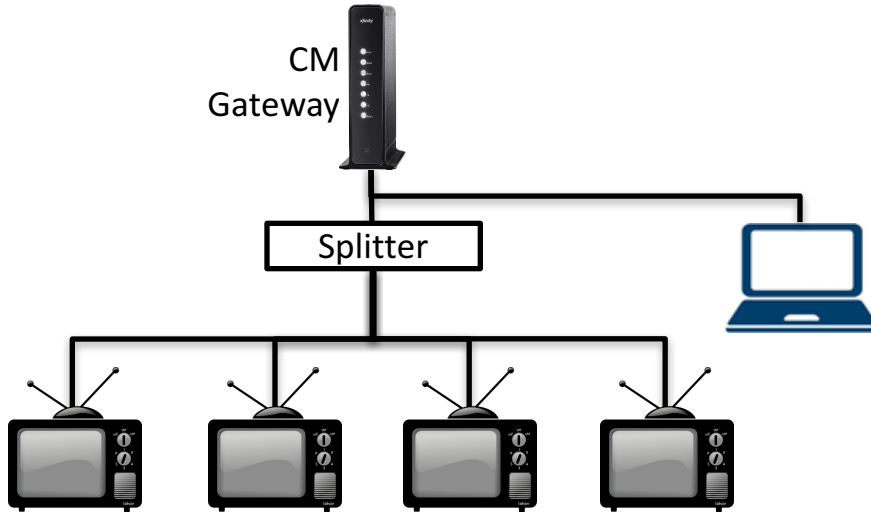

## DVR Client Requirements:

HDD, Cable Card, QAM Tuner, DOCSIS Tuner

Central DVR, TSB, GW DVR cache

# BYO CPE Era

- **Triggered by:** continued STB cost reduction, and market expansion
- MSO provided STBs would not be required
- Integrated streaming on mid-high end TVs
- Full circle from the analog era of no STB

## DVR Client Requirements:

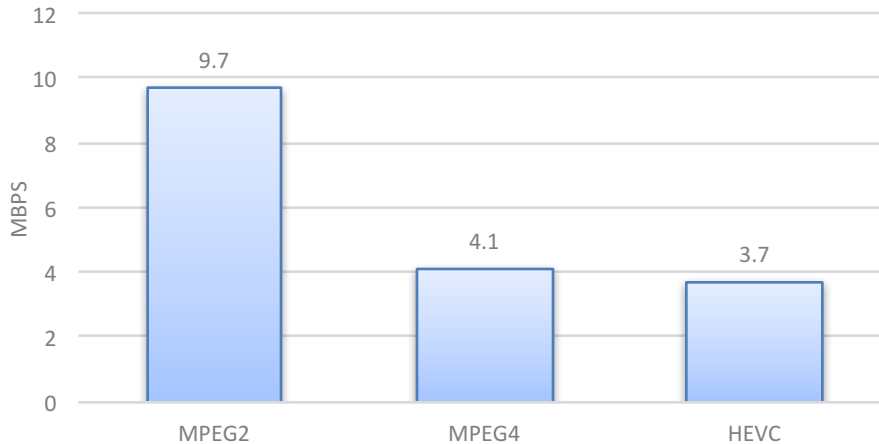

HDD, Cable Card, QAM Tuner, DOCSIS Tuner

Central DVR, **TSB**, GW DVR cache

# Wi-Fi Video Distribution

- **Video bitrate remains largely flat, considering the advancements in resolution, color depth, and framerate**

1080p30 Bitrate

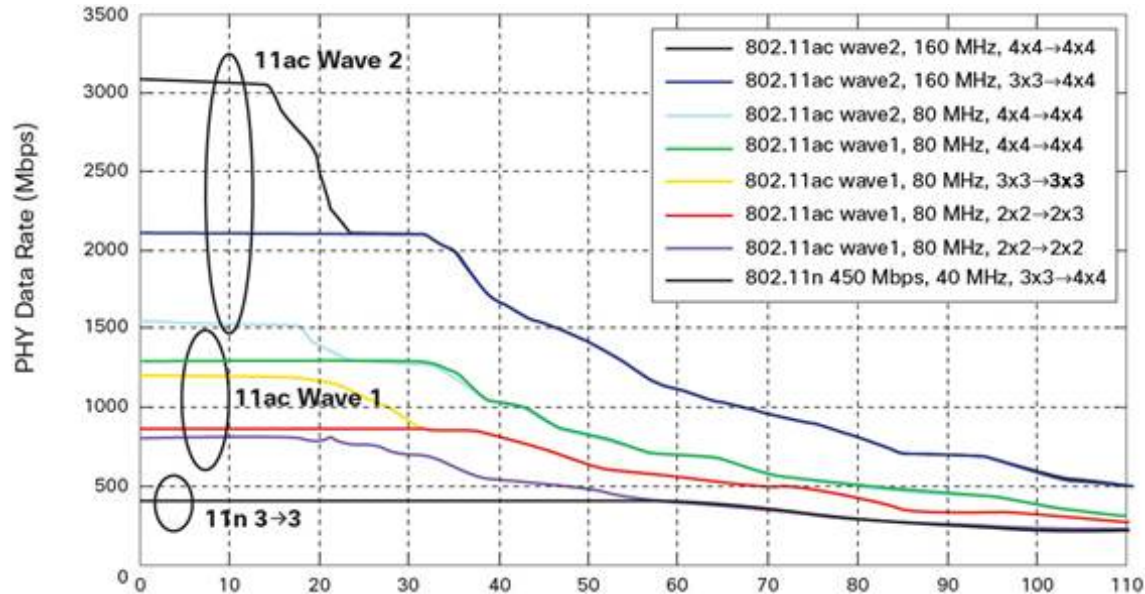

Video Bitrate as Quality Improves

# Wi-Fi Protocol Advancements

- Little is gained at extended ranges, most throughput advantages are within the first 30-40 feet
